FEATURE GUIDE

Parlon Alert Auto-Tune™

AI-driven alerting that learns your infrastructure, reduces noise, and surfaces what matters

The Problem

Modern observability tools overwhelm teams with alerts. Static thresholds generate floods of repetitive notifications tied to the same conditions, often without context or clear severity.

The Parlon Difference

Alert Auto-Tune™ transforms alerting from a noisy byproduct into an intelligent signal layer. Instead of firing endless alerts on static rules, Parlon learns system behavior over time. This ensures teams see fewer alerts, with far greater confidence and clarity.

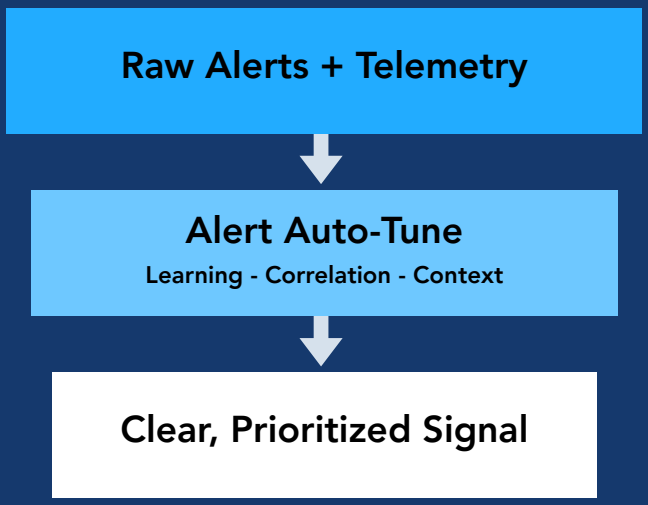
Why It Matters (In Practice)

Teams move from alert fatigue to confident action while preserving visibility into real problems.

- ~70% reduction in alert noise
- Faster prioritization of production-critical issues
- Higher trust across SRE and Ops teams
- More time resolving real problems

How Alert Auto-Tune Works

Alert Auto-Tune uses AI to continuously refine alerting using behavior, context, and correlation. Not static thresholds.



When Parlon alerts, it's worth acting on.

Learns Baselines Automatically

Uses AI to learn what 'normal' looks like by analyzing historical alerts and normalized telemetry, adapting as infrastructure evolves.

Recommends Smarter Thresholds

AI-recommended policy adjustments that suppress low-impact noise while preserving real operational risk.

Correlates and De-Duplicates Alerts

Consolidates related alerts into a single stream with escalating severity, eliminating repetitive notifications.

Adds Operational Context

Enriches alerts with environment, business importance, network zone, and tenant metadata.

- Environment (Production, Test, Dev)
- Business importance (Critical, High, Medium, Low)
- Network zone (External, DMZ, Internal, Lab)
- Tenant or customer (MSP / multi-tenant)

Continuously Improves Over Time

Re-tunes alerting as fixes are applied, helping teams uncover the next meaningful issues.

Alerting shouldn't compete for attention. It should earn it.

Parlon Alert Auto-Tune turns noisy alerts into trusted signals teams can act on.
